CS 677 Lab1 Performance Document

The latency is measured based on the time when a client executes a RPC call till it returns. The average response time is measured based on the time between the time a client initiates a buy request and the time a client receives the corresponding reply from sellers.

Configuration: 6 peers (2 buyer, 2 seller, 2 both)

	Edlab (2 machines, 3 peers on each)	Localhost
Latency (sec/req)	0.005 ~ 0.006	2 ~ 3
Avg. Response Time (sec/req)	0.04 ~ 0.15	3 ~ 9
